Cable holder - spring

knott.pl

Dear Sirs,

we would like to introduce you to a spring that allows you to keep the main cable of the trailer up, so that when the trailer is not connected to the towing vehicle, the cable is protected against damage.

This solution is ideal for trailers with a fork drawbar.

Thanks to its design, it can be used at every stage of the trailer's life. Therefore, you can retrofit an existing trailer with this solution, ensuring the safety of the electrical harness.

The spring is made of steel and protected against corrosion by galvanic zinc.

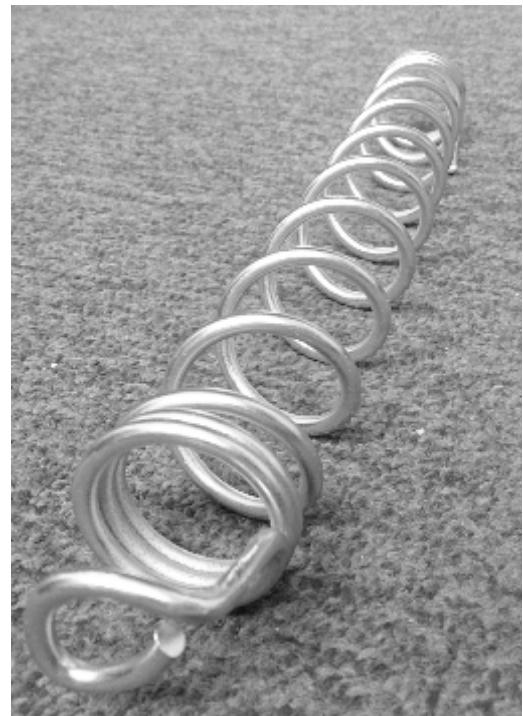

The thickness of the spring allows you to protect the cable even if it accidentally catches on an obstacle.

The design of the handle has been well thought out. The shape of the spring ensures very high mechanical strength and, at the same time, the flexibility of the whole, which allows it to adapt to possible obstacles or to be deliberately "bent" in order to connect it to a vehicle where the socket is deeper and farther from the hook.

This is a very popular solution that has found its supporters in the segment of catering and caravan trailers, where the trailer is often parked without a towing vehicle and where the traffic of bystanders is so large that the risk of damage to the cable is greater.

The most important features and advantages of the offered solution are:

- The offered cable holder secures the cable of the lighting installation against mechanical damage,
- The use of a handle allows the cable to hang freely evenwhen it is not connected to the vehicle's socket,
- The plug holder is protected against corrosion by galvanizinggalvanic,
- The holder is flexible, so it allows you to freely connect the cable to the socket of the towing vehicle,
- It has an "eye" through which the mounting screw of the overrun device is inserted, so it can be freely mounted to existing chassis and trailers,
- The article number is KK8326.
